

For a CPU the "READ value from memory at 4711" instruction looks like this ( $\mu$ OPs):

1. Check that program may read from address
2. Store the value at address in register<sup>1</sup>

MELTDOWN & SPECTRE FOR ARMED PEOPLE

'READ' INSTRUCTION

2

6

<sup>1</sup>Register: The CPU scratchpad

1

2

If  fails the program is aborted.

This can be handled by the program.

**In our burger example:**

- 1. Customer orders a burger**
- 2. Customer has not enough money**
- 3. Customer does not get his burger**

## “READ” INSTRUCTION

For a CPU the “READ value from memory at 4711” instruction looks like this (μOPs):

1. Check that program may read from address **1**
2. Store the value at address in register<sup>1</sup> **2**

If **1** fails the program is aborted.

This can be handled by the program.

**In our burger example:**

- 1. Customer orders a burger**
- 2. Customer has not enough money**
- 3. Customer does not get his burger**

<sup>1</sup> Register: The CPU's scratchpad

## MELTDOWN: READING FORBIDDEN DATA

Meltdown basically works like this:

- READ secret from forbidden address
  - 1 Check that program may read from address
  - 2 Store the read value in register
- Stash away secret
  - 1 *Magic*
- *Retrieve secret (later)*

μOPs:
