## MELTDOWN: READING FORBIDDEN DATA

Meltdown basically works like this:

- READ secret from forbidden address
  - 1 Check that program may read from address
  - Store the read value in register
- Stash away secret
  - <sup>1</sup> Magic
- Retrieve secret (later)

μOPs: 1 2 1

## MELTDOWN: READING FORBIDDEN DATA

μOPs ordered by instruction

- <sup>1</sup> Check access
- Read into register
- 1 Magic

μOPs ordered by execution

- Read into register
- 1 Magic
- 1 Check access

The re-ordering on the right happens, when the "forbidden data" is already cached (because cache access is so fast).
